

# Key long-term planning considerations with a higher share of VRE

**Asami Miketa**

**Senior Programme Officer, Power Sector Investment Planning  
IRENA Innovation and Technology Centre**

**21 April 2019**

# Power system planning: Fundamentals

How much electricity demand will there be?

How much and what type of generation is needed to serve this demand?

What enhancements to the network are needed to ensure the reliable supply of electricity?

**Energy/power system models are used to answer these questions while taking into account economic and technical consequences of alternative choices.**

# Time dimensions of power sector planning

Typical time resolution

Seasonally to sub-daily

Seasonally to sub-daily  
(Static)

Hourly to sub-hourly

Sub-hourly to sub-seconds

# Generation capacity expansion planning

## Commonly used modeling software

**Key differences: model scopes, interfaces, update frequency, user support, and cost**

# A wide spectrum of planning tools

---

## Long-term energy planning tools

Connolly et al (2010) – 37 tools

- Simulation
- Equilibrium
- Top-down
- Bottom-up
- Operation optimization
- Investment optimization

## Long-term power sector planning tools

Af-Mercados EMI (2011) – 22 tools

- Dispatch included
- Objective function
- Network included
- Stochastics modelling
- Reliability considered
- Renewable energy variability
- Forecasting errors

# Example of capacity expansion planning tools used by utilities in the MENA region

Tools [developer]	List of the countries that used the tool
<b>Aurora [EPIS]</b>	Oman
<b>EGEAS [EPRI]</b>	Egypt, Qatar
<b>EMS - Economic Dispatch [Alstom - GE]</b>	Bahrain
<b>eterracommit [Alstom - GE]</b>	Bahrain
<b>NCP [PSR]</b>	Morocco
<b>OPTGEN [PSR]</b>	Morocco
<b>Ordina [Mercados]</b>	Saudi Arabia
<b>Promod [ABB]</b>	Saudi Arabia
<b>WASP [IAEA]</b>	Algeria, Jordan, Libya, Saudi Arabia, Sudan, Tunis, UAE
<b>*Not available</b>	Iraq, Syria, Palestine

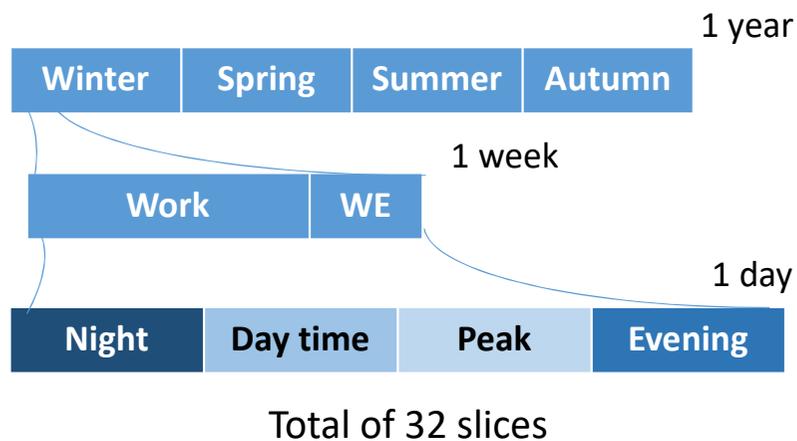

# Example of the capacity expansion tools used by governments in the LAC region

- **MESSAGE, TIMES** (Argentina, Paraguay, Peru); **OptGen** (Bolivia, Colombia, Ecuador, Peru); **PET** (Chile); **PLEXOS** (Mexico); **WASP** (Uruguay)

# Features of generation expansion planning model

- Long-planning horizon
- Capacity build up with time steps of 1-5 years
- Limited time resolution
- Limited spatial resolution

## Example of models with advanced approaches

Model name	Region	No. of time slices
GEMS +CEEM	Germany	432
DIMENSION +INTRES	Europe	192
DIMENSION	Europe	7200
US-REGEN	US	50
LIMES-EU+	Europe & Middle East and North Africa	49
URBS-EU	Europe	8064
-	Texas (US)	696

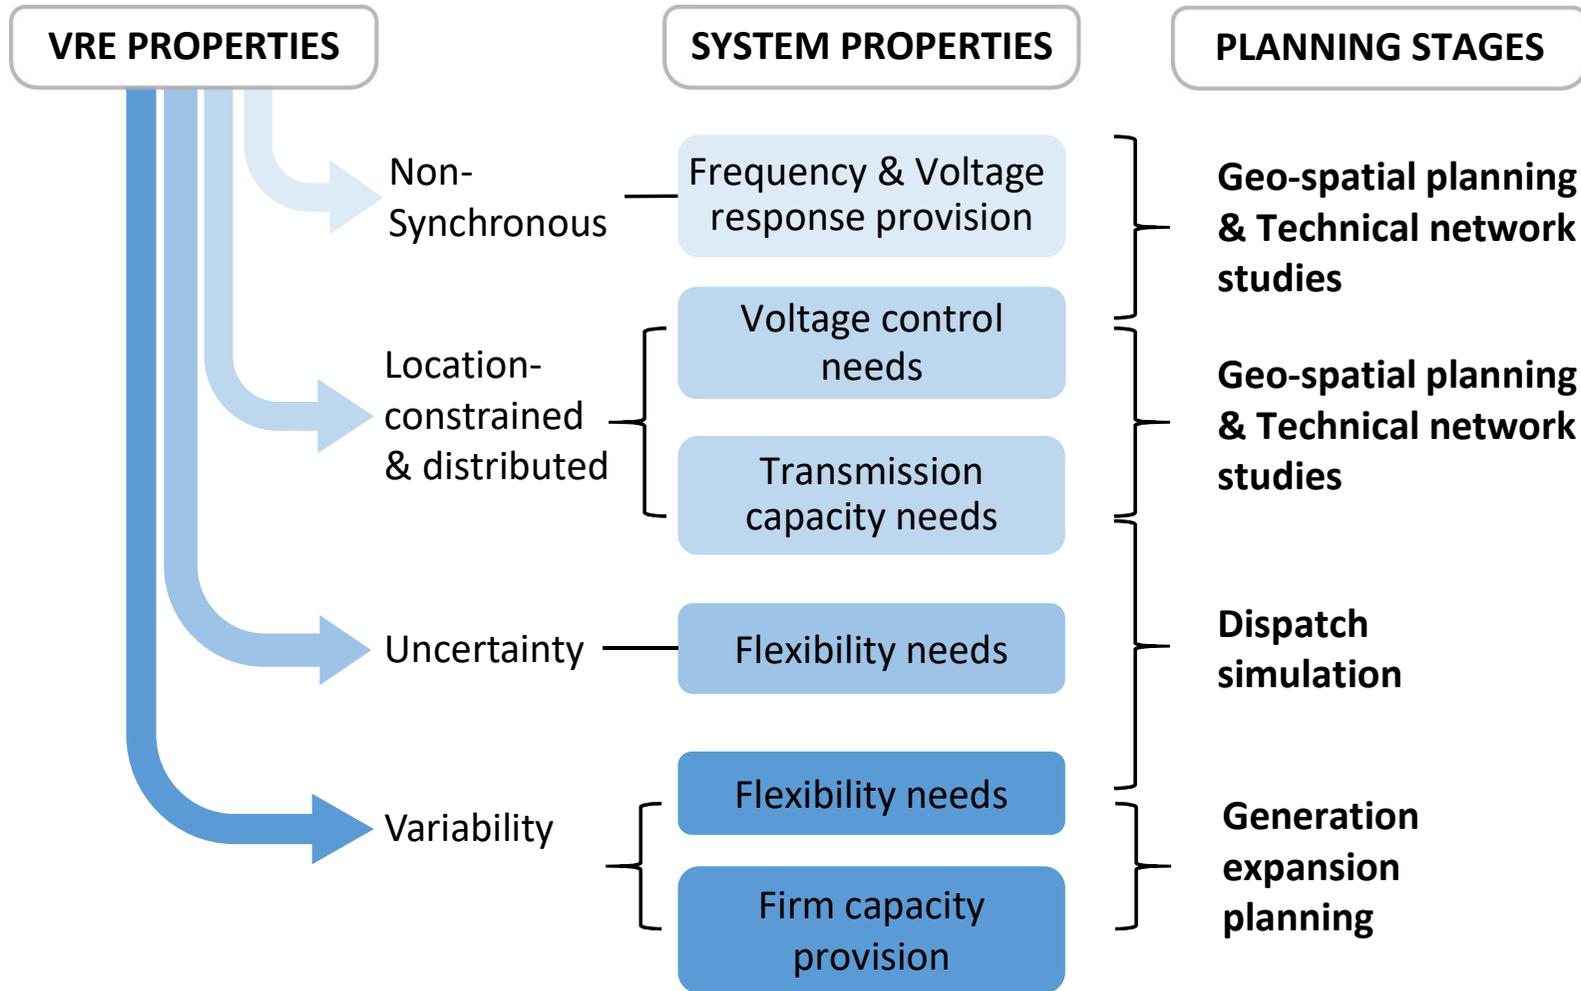

# Elements of system reliability

	Generation	Networks
Adequacy	Sufficient firm capacity	Sufficient and reliable transport and distribution capacity
Security	Flexibility of the system Stability (Robustness to contingency)	Voltage control capability Stability (Robustness to contingency)

Generation from VRE generators is variable, uncertain, location-constrained, non-synchronous, and often distributed (connected to distribution grid).

# Tools for different stages

# Elements of system reliability: Impacts of VRE

	Generation	Networks
Adequacy	Variability reduces contribution to firm capacity	Location-constraints may require grid extension and reinforcement
Security	<p>Variability and limited predictability requires system to follow residual load</p> <p>Lack of inertia and governor response may pose the technical limit to VRE penetration</p>	<p>Location-constraints may change voltage control requirements</p> <p>Distribution level connection may affect voltages and protection system coordination</p> <p>RE's behavior during fault may affect system stability</p>

# VRE: Long-term investment implications

	Generation	Networks
Adequacy	Firm capacity	Transmission capacity
Security	Flexibility	Voltage control capability
	Stability (frequency response and voltage response)	

Most relevant

High relevance

System-specific

Near-term relevance

# Key features of solar and wind

- » Rapid cost reduction
- » Firm capacity / capacity credit
- » Flexibility
- » Transmission investment needs
- » Stability consideration

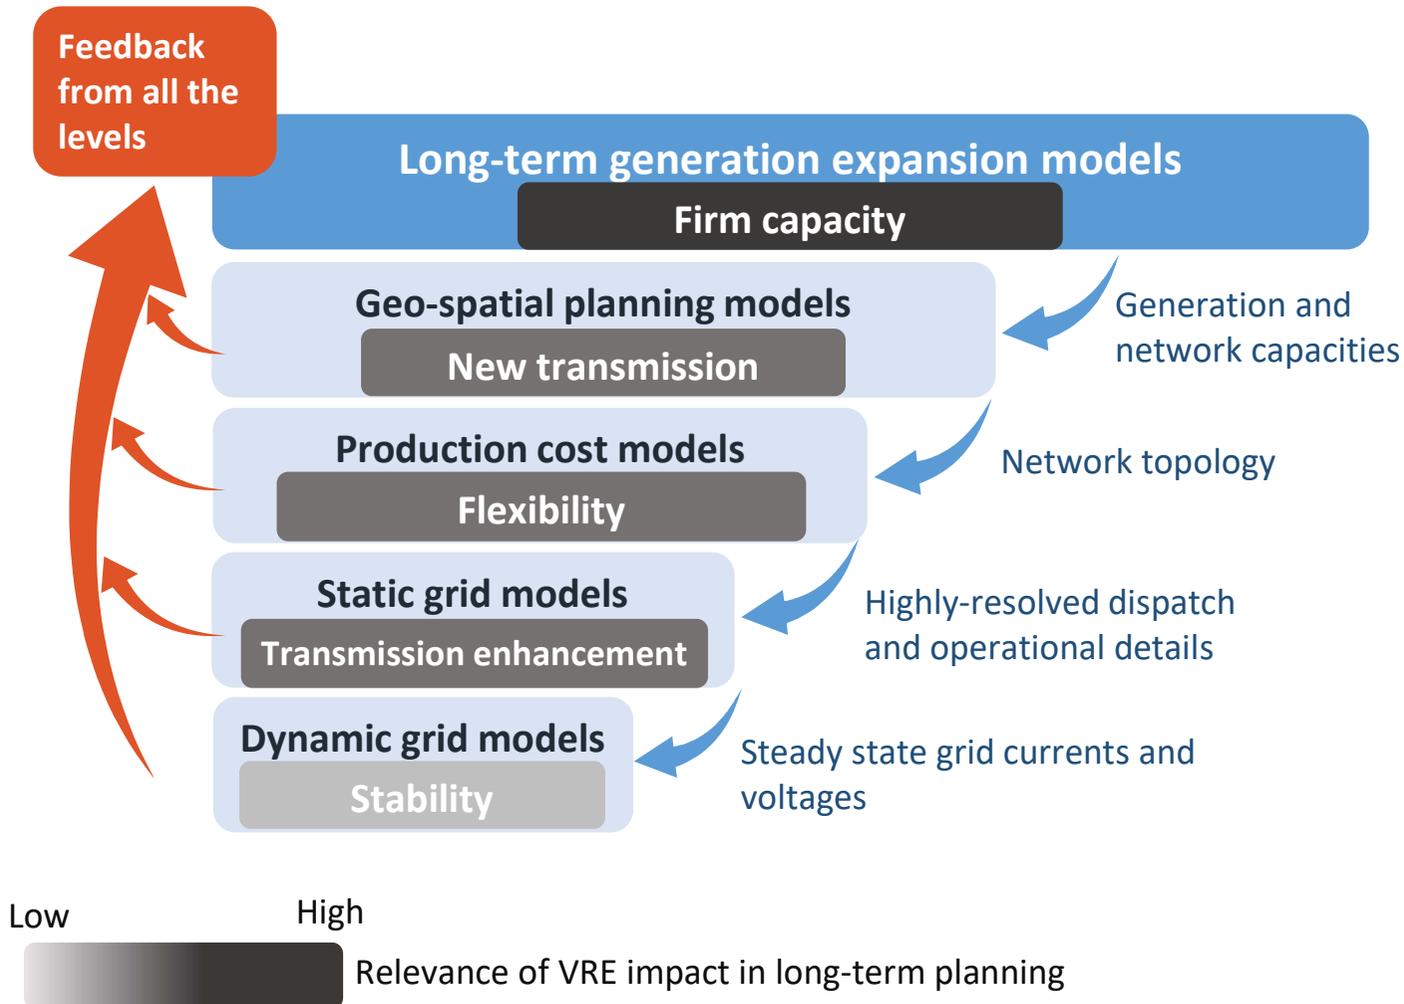

**Typically not well covered** in “traditional” generation expansion planning models and methodologies

	Generation	Networks
Adequacy	<b>Firm capacity</b>	<b>Transmission capacity</b>
Security of operation	<b>Flexibility</b>	<b>Voltage control capability</b>
	<b>Stability (frequency response and voltage response)</b>	

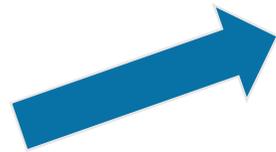

Most relevant <span style="display: inline-block; width: 15px; height: 15px; background-color: #800000; vertical-align: middle;"></span>	System-specific <span style="display: inline-block; width: 15px; height: 15px; background-color: #FF8C00; vertical-align: middle;"></span>
High relevance <span style="display: inline-block; width: 15px; height: 15px; background-color: #FF8C00; vertical-align: middle;"></span>	Near-term relevance <span style="display: inline-block; width: 15px; height: 15px; background-color: #ADD8E6; vertical-align: middle;"></span>

# Application of planning tools ... with VRE

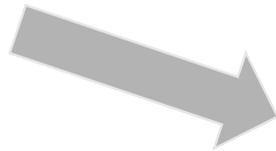

# It is important to do it right from the beginning!

**How?**

Improve long-term energy planning modeling methodologies by incorporating key VRE features

Coordinated planning across planning bodies

# How can generation expansion models incorporate these feedbacks?

---

- » Creation of a “super model”?
- » Model coupling?
- » Simplified representation of the key elements in a simplified manner?
  - Input data preparation (better temporal and spatial resolution RE generation data)
  - Model constraints

**To be addressed in the open discussions of this workshop**

# Notes on choice of software

---

Key differences: model scopes, interfaces, update frequency, user support, and cost

**The choice of software is often a secondary issue; more important is how to better use them!**

Difficult to make an objective assessment on desirability of one software than others

Discuss with the software developer – and the key software issues for VRE are summarized as 5 check points

# Key features of solar and wind

- » Rapid cost reduction
- » Firm capacity / capacity credit
- » Flexibility
- » Transmission investment needs
- » Stability consideration

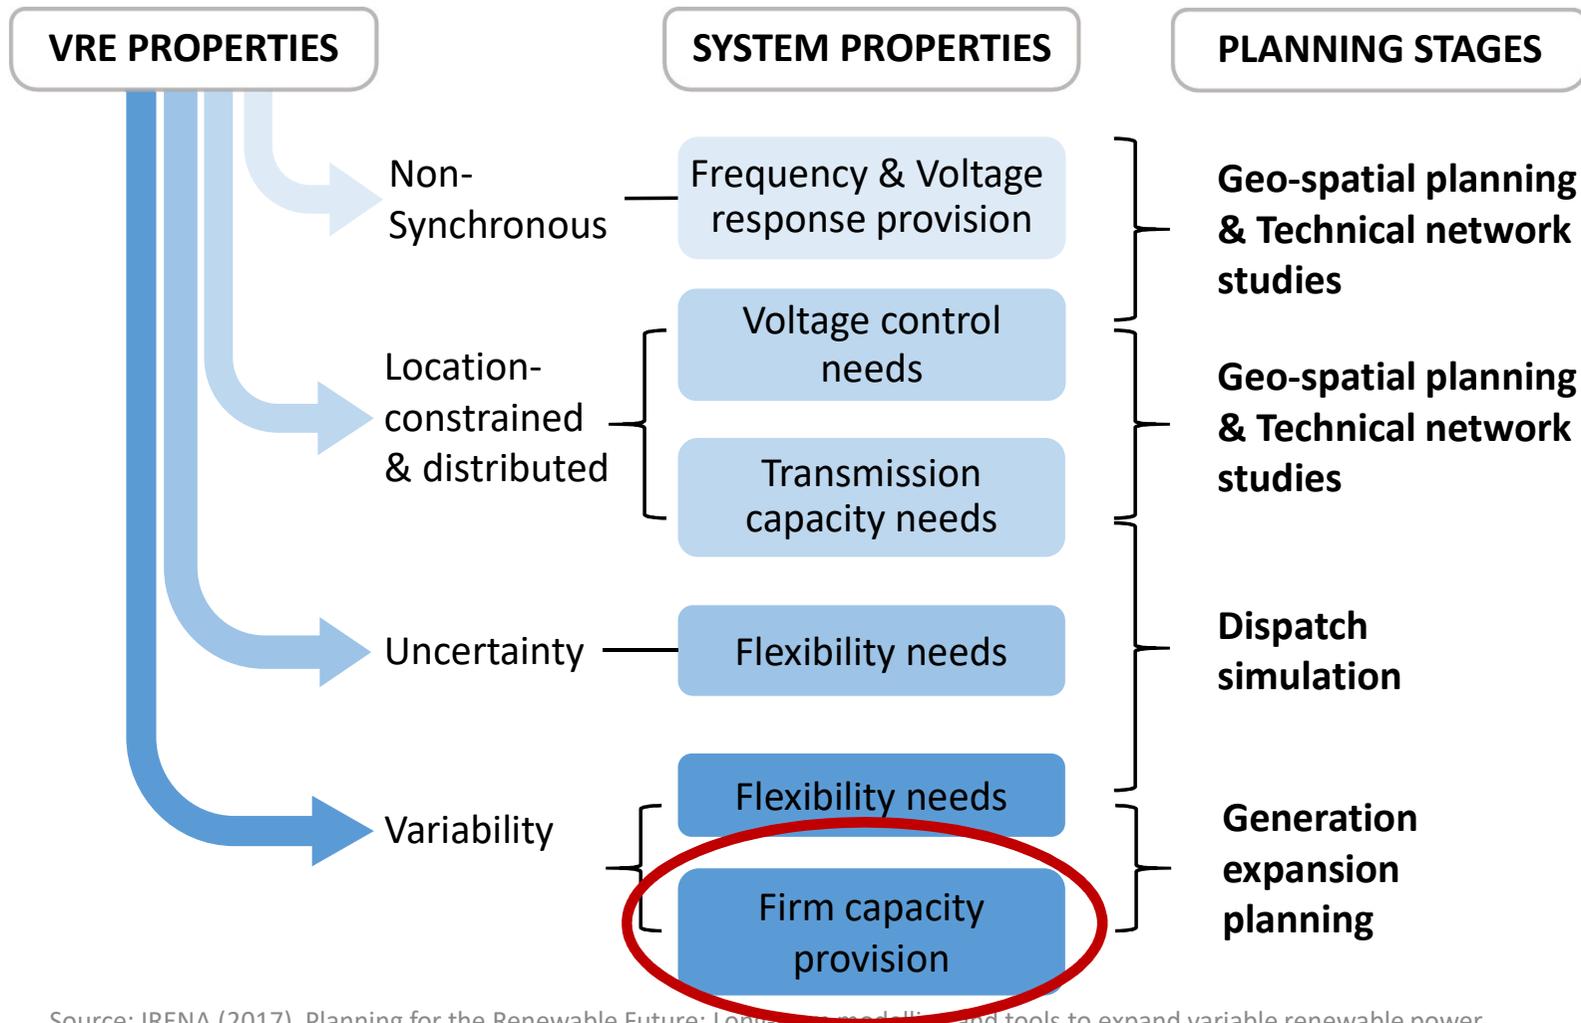

# Check point 1

- » Fast cost reduction
- » Firm capacity / capacity credit
- » Flexibility
- » Transmission investment needs
- » Stability consideration

Planning that takes into account long-term cost reduction potential can ensure long-term cost effectiveness of the energy system and avoid technology lock-in.

# Check point 2: Adequate firm capacity

Source: IRENA (2017), Planning for the Renewable Future: Long-term modelling and tools to expand variable renewable power in emerging economies

## Check point 2-1

Does the model reflect the solar and wind variability based on meteorological data?

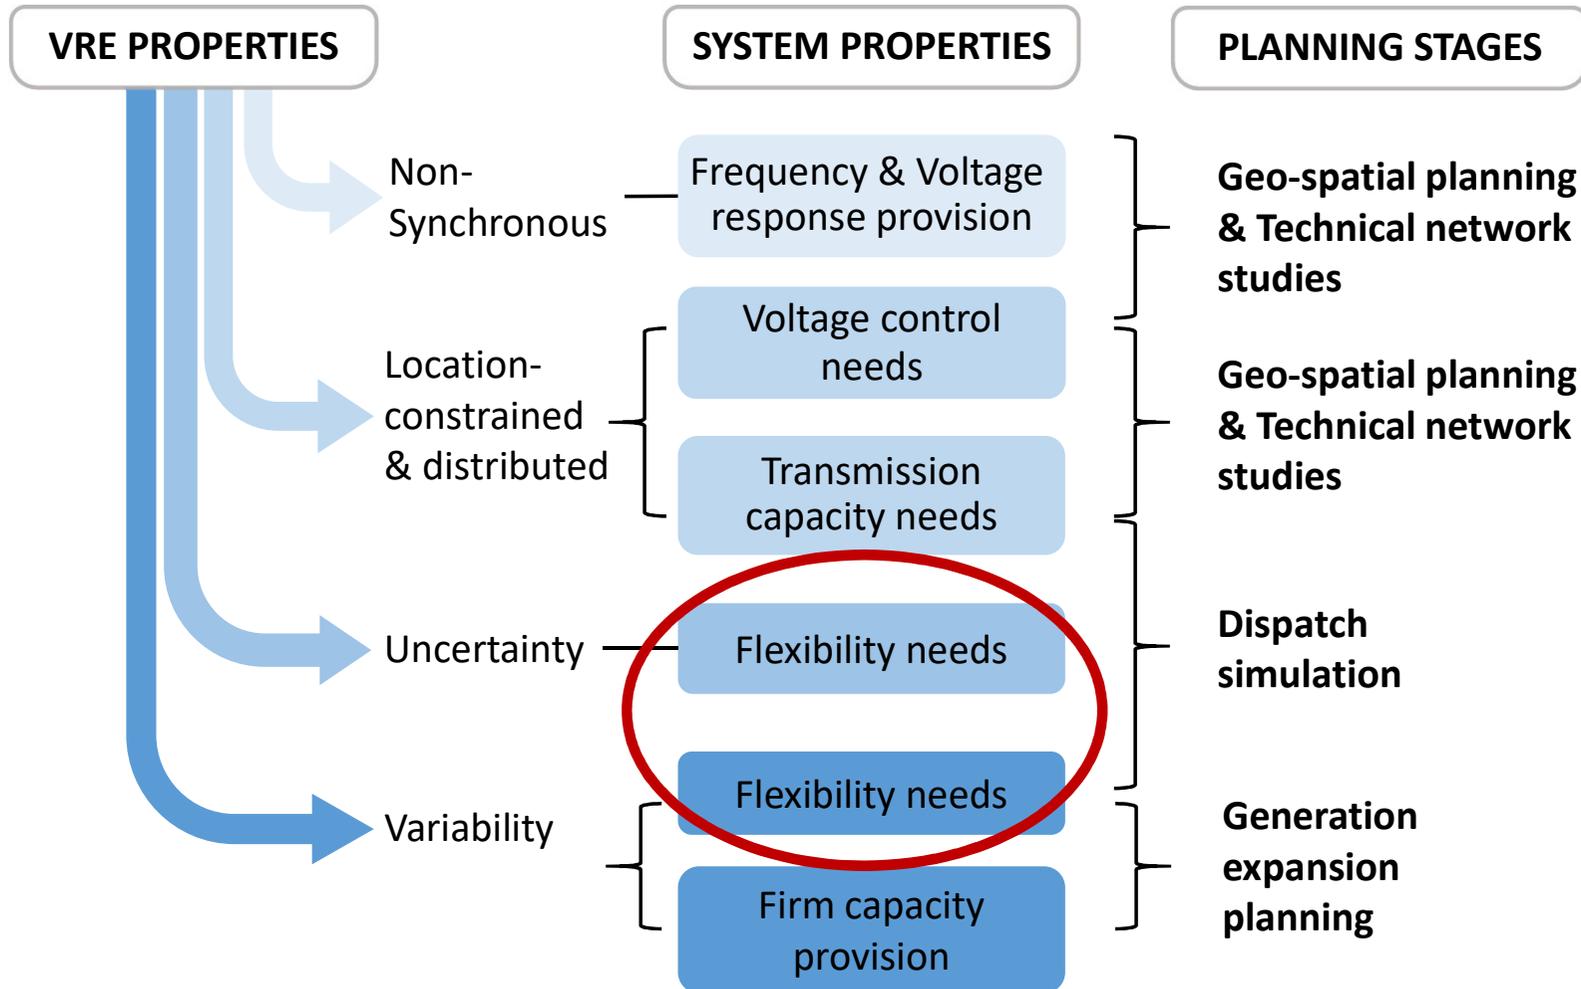

## Check point 2-2

Is the **capacity credit** of VRE reflected in the reserve margin requirement in the model, so that long-term generation plans ensure the sufficient generation at all times?

# Check point 3: Flexibility needs

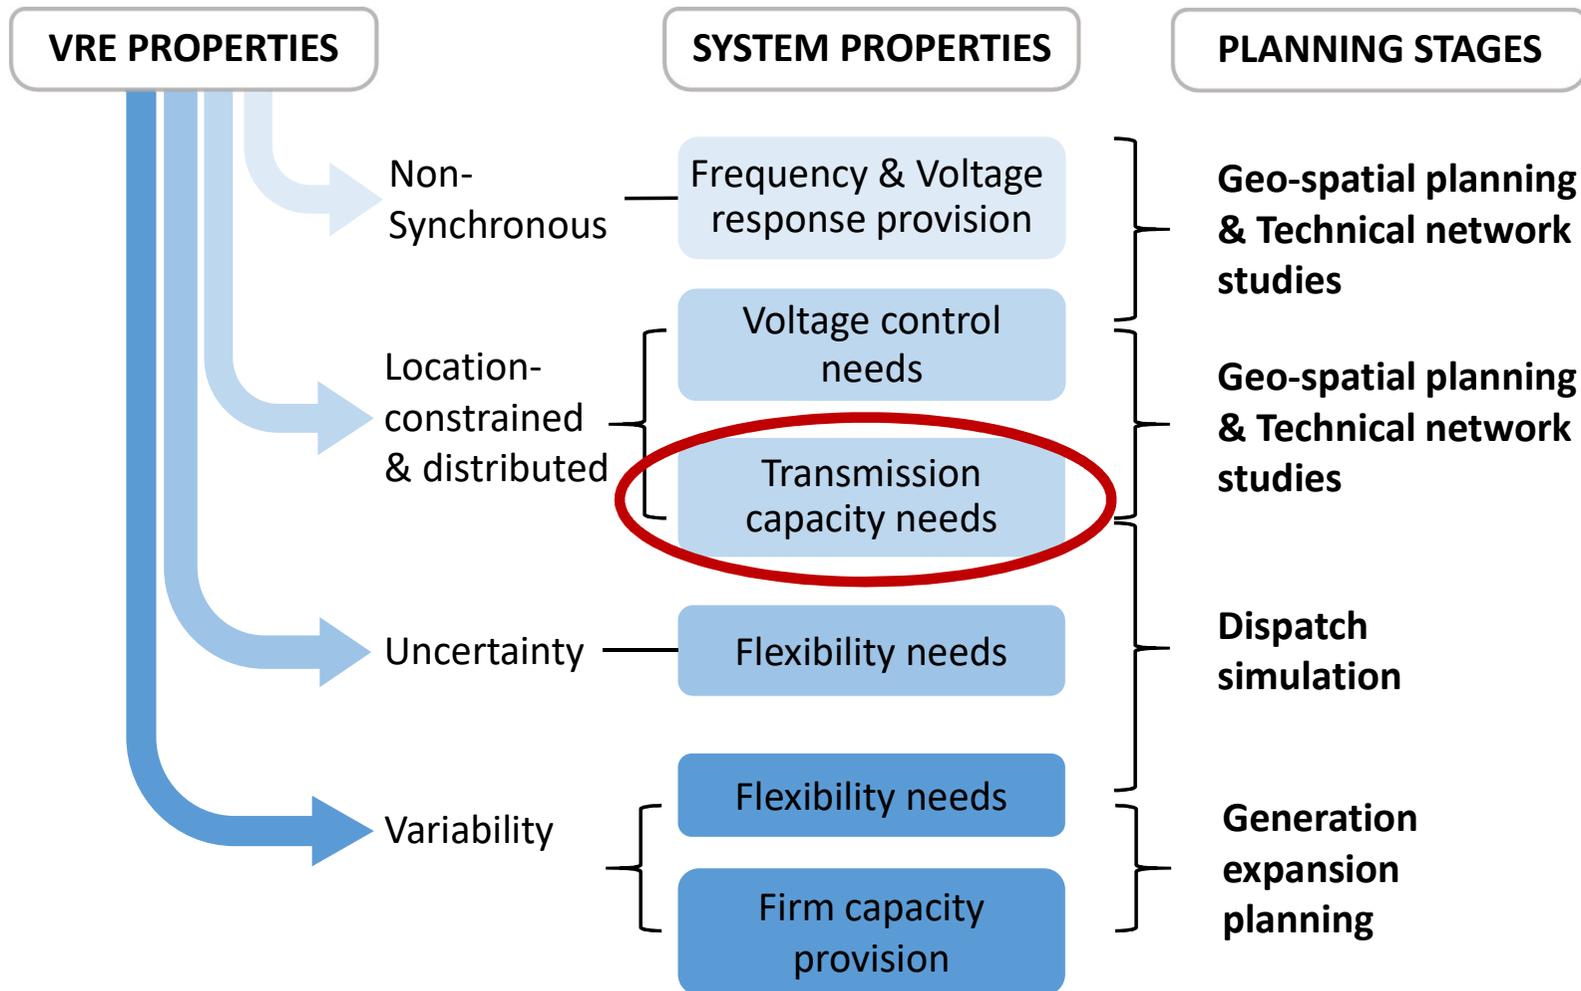

Source: IRENA (2017), Planning for the Renewable Future: Long-term modelling and tools to expand variable renewable power in emerging economies

## Check point 3

Is the flexibility of a power system properly represented in the model? Do we know how much flexibility would be needed and how much would be met by what?

# Check point 4: Transmission capacity

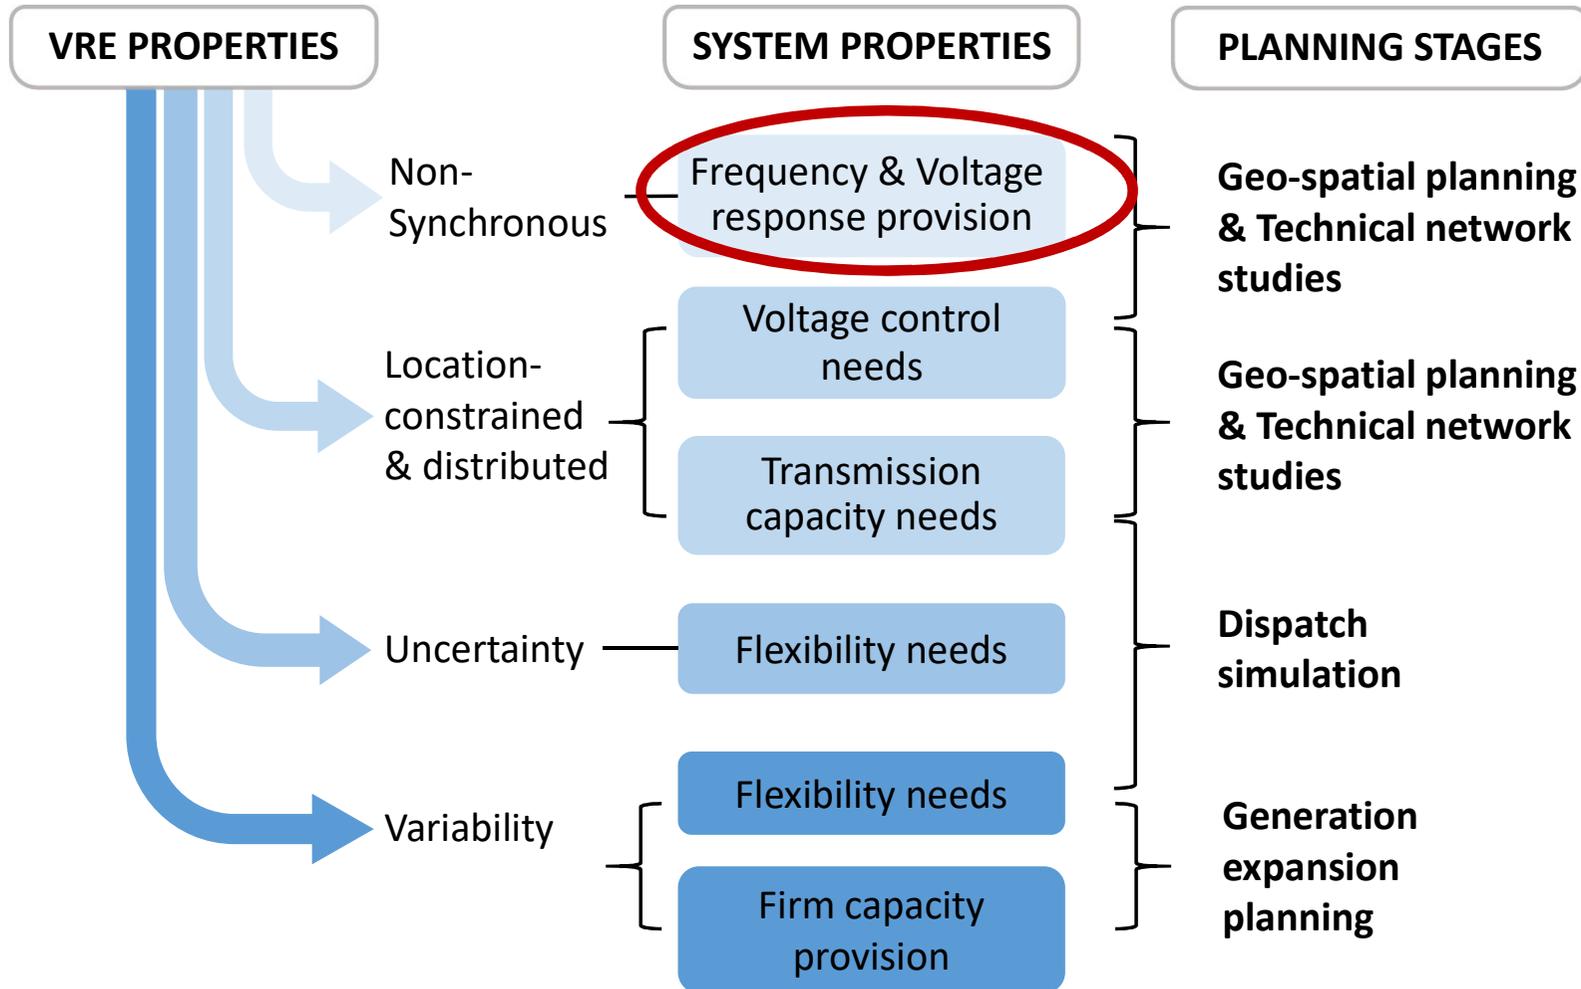

Source: IRENA (2017), Planning for the Renewable Future: Long-term modelling and tools to expand variable renewable power in emerging economies

## Check point 4

Is the trade-off between resource quality and transmission investment needs analyzed in the model?  
Is the resource quality assessed using the geo-referenced data?

# Check point 5: stability constraints

Source: IRENA (2017), Planning for the Renewable Future: Long-term modelling and tools to expand variable renewable power in emerging economies

## Check point 5

Do we expect a technical limit to instantaneous penetration of solar and wind? If so, is it a hard limit, or depending on institutional arrangements? Are these limits modelled as scenarios?
